

Requirements Gathering

3.1 Stakeholder Analysis

Identifying the key individuals and groups involved in or affected by the **FurniZone** project:

- **End-Users (Customers):** Individuals looking for a convenient way to browse and discover modern furniture. Their primary need is a fast, visually appealing, and easy-to-navigate interface.
- **Store Administrators:** Responsible for managing the furniture catalog. Their need is a structured system where products are organized by category and details are clearly displayed.
- **Developers (Backend/Frontend):** Interested in the technical scalability and maintainability of the project.
- **Project Lecturer / Evaluator:** Focused on the application of Angular concepts, code quality, UI/UX standards, and thorough documentation.

3.2 User Stories & Use Cases

To illustrate how users interact with FurniZone:

User Stories

- *As a visitor*, I want to browse furniture by category (e.g., Bedroom, Living Room) so that I can find exactly what I need quickly.
- *As a customer*, I want to see high-quality images and detailed prices for each item to help me make an informed decision.
- *As a mobile user*, I want the website to be fully functional on my phone so I can shop on the go.

Use Case: Product Discovery

- **Actor:** End-User.
- **Description:** The user navigates to the home page, selects the "Office Furniture" category, and views a filtered list of desks and chairs.
- **Outcome:** The user finds a specific item and clicks on it to see further details.

3.3 Functional Requirements

These define the specific features and functionalities of the website:

- **Product Display:** The system shall display a grid of furniture products including an image, name, and price.
- **Categorization System:** The application must allow users to filter products based on categories (Living Room, Bedroom, Office, Décor).
- **Product Detail View:** Users shall be able to click on any product to view an expanded description and specifications.
- **Responsive Navigation:** The website must include a navigation bar (Navbar) that adapts to different screen sizes.
- **Search Functionality:** A feature to allow users to search for specific items by name.

3.4 Non-functional Requirements

These define the quality attributes and constraints of the system:

- **Performance:** The website should load its main components within 2 seconds to ensure a smooth user experience.
- **Usability:** The interface must follow a "Clean Design" principle, making it intuitive for users with no prior technical knowledge.
- **Responsiveness:** The layout must be 100% responsive, providing a consistent experience across Desktops, Tablets, and Smartphones.
- **Maintainability:** The code should follow Angular's component-based architecture to allow for easy updates and future feature additions (like adding a backend).
- **Reliability:** The application should handle missing images or broken links gracefully without crashing the UI.
